

Wash & Wax Sachets

The water-soluble contents are diluted in a water container. Then the solution is poured into the machine, which is then pumped to the correct pressure to activate the spray nozzle.

The vehicle is then sprayed with a thin layer of wax, which emulsifies with the dirt molecules, breaking them down and lifting them off the surface.

Next, a water container is filled, where the blue microfibre cloth is dampened and used to wipe off the wax and remove the dirt.

The green cloth can then be used to buff the vehicle, creating a showroom finish in minutes.
